How Bees Make Honey

Grades 1-2

Nonfiction

- 1 Honeybees are busy insects. They fly from flower to flower all day long.
- 2 Inside each flower is a sweet juice called nectar. A bee sips the nectar with its long tongue and keeps it in a special honey stomach.
- 3 When its honey stomach is full, the bee flies back to the hive. It passes the nectar to other bees.
- 4 The bees put the nectar into little wax rooms called cells. Many cells together make a honeycomb.
- 5 Next, the bees fan their wings over the cells. The moving air dries out the nectar, and it slowly turns thick and sticky. Now it is honey!
- 6 The bees close each cell with wax. They save the honey to eat in winter, when there are no flowers.
